**Some Useful Terms and Abbreviations:**

**Amps to Watts** .....Amps x Volts = Watts

**BTU** .....British Thermal Unit

To determine correct heater size:

1. Calculate the cubic feet of the area to be heated:  
Cubic feet of area = Length x Width x Height
2. Take that answer and multiply by 0.133
3. The result of that answer is then multiplied by the change  
In temperature you need to achieve.
4. The final answer is the number of BTU's required to heat that  
Space to the temperature required.  
(Area x 0.133) x Change in Temperature (in degrees)

**Cap** .....Capacity

**CFM** .....Cubic Feet per Minute

**CO2** .....Carbon Dioxide

**Cord of Firewood** .....128 Cubic Feet (4'x4'x8')  
(approximately 3500 lbs - will vary with species and dryness)

**Cubic Yard** .....27 cubic feet (3'x3'x3')

**Cubic Yard of Dirt/ Top Soil** .....Approx. 2000 lbs
